Quick install

One page. Five minutes, no internet, nothing to install first — Python comes inside the package. The full installation manual (`docs\INSTALL.html`) covers backups, updates, another port, uninstalling and every message the installer can print.

Free software under the GNU AGPL-3.0 (`LICENSE.txt`): anyone may use, copy, change and share the application and its documentation, with no authorisation needed, as long as the author credit is kept (`NOTICE.txt`). `THIRD-PARTY-NOTICES.txt` lists every component's licence.

What you need

- **Windows 10 or 11, 64-bit**, with about 1 GB of free disk.
- **Administrator rights are not required.** With them, run `setup.bat` ; without them (a managed computer where IT will not grant them), run `setup-noadmin.bat` instead — the application installs for your account only, in your own profile, and nothing is written outside it. If IT offers to type an administrator's password for you, decline: the application would be installed into *their* profile, and the installer refuses it.
- A current **Google Chrome, Microsoft Edge or Mozilla Firefox**.
- The file `ner-analyzer-4.4.0-windows.zip` (about 100 MB), downloaded from the link you were sent.

Install it

1. **Unblock the zip** (optional, saves a Windows warning): right-click `ner-analyzer-4.4.0-windows.zip` → *Properties* → tick *Unblock* → *OK*.
2. **Unzip it**: right-click → *Extract All...*. Your Downloads folder is fine — nothing stays there. Do not run anything from inside the zip.
3. Open the `ner-analyzer` folder. **With administrator rights:** right-click **`setup.bat`** → **Run as administrator** → *Yes* (a plain double-click also works: it asks Windows for the rights itself). **Without them:** double-click **`setup-noadmin.bat`** . A black window runs through six numbered steps, two to five minutes.
4. Your browser opens at `http://127.0.0.1:8000` and an **NER Analyzer** shortcut appears on the desktop. **Create the first account** — username, name, a password of at least 10 characters. There is no default user or password; the first account is the administrator.
5. Back in the black window, press any key. It closes and, a few seconds later, deletes the unzipped folder and the zip. Only the application is left, running.

WHERE IT WENT

`C:\Users\<you>\AppData\Local\Programs\ner-analyzer`. It starts by itself every time you sign in to Windows, with no window; a watchdog restarts it within two minutes if it ever stops. From now on, open it with the desktop shortcut or by typing `127.0.0.1:8000` into the browser. The application runs only on your computer and makes no connection to the internet.

On a Mac

For a MacBook with an **Apple Silicon** processor (M1 or later — Apple menu → *About This Mac* says *Chip Apple M…*), macOS 11 or later, about 1 GB free. No administrator password is needed. The file is `ner-analyzer-4.4.0-macos-arm64.zip` (about 110 MB).

1. **Unzip it**: double-click the zip in Downloads. A `ner-analyzer` folder appears (sometimes inside a folder with the zip's name).
2. Open **Terminal** (Spotlight: `⌘` + `Space`, type *Terminal*). Type `bash` and a space, **drag** `setup.command` from the `ner-analyzer` folder into the Terminal window, and press `Return`. Six numbered steps follow, one to three minutes.
3. Your browser opens at `http://127.0.0.1:8000` and an **NER Analyzer** link appears on the Desktop. **Create the first account**, as above.
4. Press `Return` in Terminal and close it. The unzipped folder and the zip are already gone.

WHERE IT WENT

`~/Applications/ner-analyzer` (your home folder → *Applications*). It starts by itself when you sign in to the Mac and again if it ever stops. Its `mac` folder holds `stop`, `start`, `backup` and `uninstall`. Updating is the same four steps with the new zip: the data is backed up and kept. Double-clicking `setup.command` also works, but macOS answers *Apple could not verify…* the first time: click *Done*, then *System Settings* → *Privacy & Security* → *Open Anyway*. The Terminal way above avoids that.

Update to a new version

Exactly the same five steps with the new zip. The installer recognises the installed version, backs up its database, keeps every project, account and drawing, and replaces the program files. Press `Ctrl` + `Shift` + `R` once in the browser afterwards. The version you replaced is kept next to the new one as `ner-analyzer.previous` until the next update; delete it once the new version works. No administrator rights are needed for an update either: `setup-noadmin.bat` (or `setup.command` on a Mac) installs over the old version for your account and keeps every project.

If something goes wrong

YOU SEE	DO THIS
`Open File – Security Warning / SmartScreen`	Click *More info* → *Run anyway* (or *Run*). The scripts are plain text — open them in Notepad if you want to read them.
`The administrator rights were not granted`	The Windows prompt was answered *No*, or your account cannot get them. The window then asks *Install without administrator rights, for this account only? [Y/N]* — answer `Y`. Or close it and double-click `setup-noadmin.bat`.
`This window runs as another account than the person signed in`	Someone typed another account's password into the prompt. Get the rights on *your* account, sign in as yourself, run it again.
`The browser says the site cannot be reached`	The server is still starting (20 to 40 seconds after a sign-in). Wait and reload.
`An amber pill in the top bar, or a blank page`	The browser kept an old copy of the interface: `Ctrl` + `Shift` + `R`.
`Mac: this Mac has an Intel processor`	This package is for Apple Silicon (M1 or later). An Intel Mac needs another package — ask Marcelo.
`Mac: Operation not permitted` or nothing happens	A managed Mac (company profile) may block scripts from Downloads. Move the unzipped `ner-analyzer` folder to your Desktop and repeat step 2; if it still refuses, IT has to allow it.
`Forgot your password`	Ask the administrator to use *Reset password* in the app. If there is none, or it is you: in the installed folder, double-click `reset-password.bat` (Mac: `mac/reset-password.command`), choose the account and type the new password twice.
`Anything else`	Read the message in the black window — it says what stopped and nothing was changed — then check *Common problems* in `docs\INSTALL.html` inside the installed folder, or send a screenshot of the window to Marcelo.
